## Final Report

Approved for public release; distribution is unlimited.

Prepared for     U.S. Army Corps of Engineers  
                      Washington, DC 20314-1000

Under             Work Unit #LB6D4B

**ABSTRACT:** Threatened and Endangered Species (TES) pose a significant conservation and compliance challenge for natural resources management on military lands. In FY 2003, the Army spent over \$30 million dollars on TES management issues. In addition to the stewardship challenges TES represent to the Army, TES are a significant factor in the restriction of military activities on training lands and thus affect military readiness. One factor that may represent a significant threat to the Army's ability to effectively manage TES and their habitat on military lands is the presence of Non-Indigenous Species (NIS). NIS alter the structure, function, and organization of ecological systems, thereby affecting the suitability of the habitat to support endangered populations.

This research documents invasive plant species that have a high probability of existing in the same geographical areas as Army installations that have populations of high priority TES. This study is limited to Army installations with current populations of the top seven high-priority, federally listed, TES.

## Preface

This study was conducted for the Office of the Director of Environmental Programs under A896, “Base Facilities Environmental Quality”; Work Unit number LB6D4B, “Threat Assessment of Invasive Species on TES.” The technical monitor was Mr. William Woodson, DAIM-ED.

The work was performed by the Ecological Processes Branch (CN-N) of the Installations Division (CN), Construction Engineering Research Laboratory (CERL). The CERL Principal Investigator was Patrick J. Guertin. Steve Hodapp is Program Manager for the Army endangered species research program. Alan B. Anderson is Chief, CEERD-CN-N, and L. Michael Golish is Acting Chief, CEERD-CN. The associated Technical Director was Dr. William D. Severinghaus, CEERD-CV-T. The Acting Director of CERL is Dr. Ilker Adiguzel.

CERL is an element of the U.S. Army Engineer Research and Development Center (ERDC), U.S. Army Corps of Engineers. The Commander and Executive Director of ERDC is COL James R. Rowan, and the Director of ERDC is Dr. James R. Houston.

# 1 Introduction

## Background

Threatened and Endangered Species (TES) pose a significant conservation and compliance challenge for natural resources management on military lands. As of 2003, 175 Federally Threatened or Endangered species were identified on 99 Army installations (Rubinoff et al. 2004). In FY 2003, the Army spent over \$30 million dollars on TES management issues (Rubinoff et al. 2004). In addition to the stewardship challenges TES represent to the Army, TES are a significant factor in the restriction of military activities on training lands and thus affect military readiness.

One factor that may represent a significant threat to the Army's ability to effectively manage TES and their habitat on military lands is the presence of Non-Indigenous Species (NIS). To date, no comprehensive study has been conducted to understand the impact NIS may have on military TES. However, considering that NIS represent a significant threat to TES in general; being the main cause for the listing of 46% of all TES (Wilcove et al. 1998), affecting 30% of all threatened birds, and 15% threatened plant species, and that NIS represent the second largest threat to global diversity annually (GovExec.com, December 18, 2003); the threat has a certain probability to be real. NIS alter the structure, function, and organization of ecological systems (Sheley and Petroff 1999). These alterations impact the suitability of habitat to support endangered populations.

## Objective

The objective of this research is to document invasive plant species that have a high probability of existing in the same geographical areas as Army installations that have populations of high priority TES. High priority TES were identified by the Army Conservation Technology Team based on the current or potential risk of training restrictions associated with that species or its habitat. Not surprisingly, these species are among the list of highest reported management costs on a per-species basis (Rubinoff et al. 2004). NIS refers to any species (e.g., plant, animal, or insect) that is non-native to the geographical area in question. For this report, only plant species were investigated; therefore, in the context of this report, the terms NIS and invasive plants are used interchangeably.

Understanding the potential for a defined group of NIS to exist on and near installations is the first step in understanding which invasive species may have a direct impact on a threatened or endangered species.

## Approach

The approach for this investigation was divided into two steps. The first step was to develop a list of Army installations that are identified as having populations of the top seven priority TES. These species are: desert tortoise (*Gopherus agassizii*), gopher tortoise (*Gopherus polyphemus*), grey bat (*Myotis grisescens*), Indiana bat (*Myotis sodalis*), red-cockaded woodpecker (*Picoides borealis*), black-capped vireo (*Vireo atricapillus*), and golden cheeked warbler (*Dendroica chrysoparia*). The second step was to compile a database of all potential NIS that may reside on installations or have the potential to invade into installations that may have priority TES.

## Scope

The scope of this study is limited to Army installations with current populations of the top seven high-priority, federally listed, TES as defined within the *Army Environmental Requirement 4.3.e*, “Non-Native Invasive Species Control for Army Installations and Operations.” The scope is also limited to NIS investigation of invasive plant species.

## Mode of Technology Transfer

This research can be used by installation land managers as the first building block in assessing interactions and impacts on TES from non-indigenous species.

This report will be made accessible through the World Wide Web (WWW) at URL: <http://www.cecer.army.mil>

## 2 Methodology

Methodology for this study comprised (1) development of data covering threatened and endangered species on specific Army installations, (2) development of data representing probable NIS populations on these installations, and (3) development of a database pairing these results. Data development focused primarily on Army sources of data for TES distribution and federal, state, and local government sources, as well as from private conservation groups for NIS data. Full descriptions of data and sources are provided in the following sections. Data was compiled in a database with each TES occurring on an installation paired with all NIS that had the potential to exist within that geographical area. Additionally, each NIS listed contains the county in which it has been reported as occurring (Appendix A).

### TES Data

As identified in *Army Environmental Requirement 4.3.e*, “Non-Native Invasive Species Control for Army Installations and Operations,” the seven priority threatened species included in this study are: desert tortoise (*Gopherus agassizii*), gopher tortoise (*Gopherus polyphemus*), grey bat (*Myotis grisescens*), Indiana bat (*Myotis sodalis*), red-cockaded woodpecker (*Picoides borealis*), black-capped vireo (*Vireo atricapillus*), and golden cheeked warbler (*Dendroica chrysoparia*). All TES population data used in this study came from the 2001 TES survey compiled by the Army Environmental Center, the best available data source at the time. AEC published 2003 survey results in mid-year 2004. The 2003 data included minor changes in installations listed; however these changes were not included as accompanying NIS data was not available. The 2001 AEC survey only accounted for federally listed species; therefore, installations that may have a population that is listed in one part of the country but not in all areas, were not considered. One example of this scenario is the gopher tortoise; the western population is listed as threatened and occurs on Camp Shelby, Mississippi, while the eastern population that is not listed occurs on several installations including Fort Stewart, Georgia, and Fort Rucker, Alabama, so only Camp Shelby is listed.

In summary, 36 Army installations were reported as having priority TES populations, with 7 installations having 2 different species. The number of installations per species is depicted in Figure 1. Table 1 lists installations and their corresponding TES that were considered in this study.

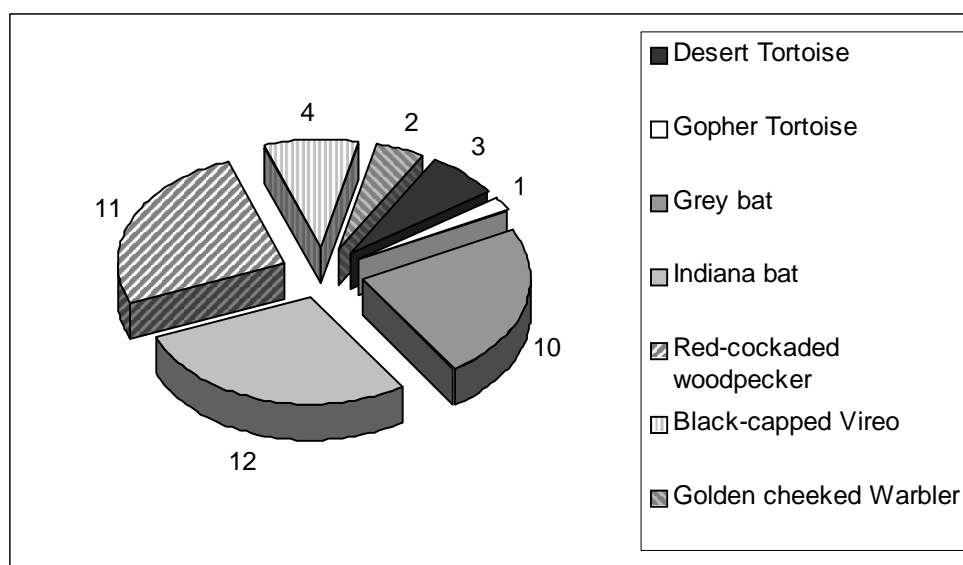

Figure 1. The priority TES according to number of installations on which they occur.

## NIS Data

NIS information was gathered through a number of federal, state, and local government sources, as well through non-governmental groups. The primary source for most of this data was the U.S. Department of Agriculture, Natural Resource Conservation Service with supplemental data coming from entities such as the The Nature Conservancy, the University of Montana, Purdue University, and state natural resource agencies. A complete list of sources is presented in Appendix B.

The approach for data gathering was to obtain species lists of NIS plants that occur in counties that contain installations and those counties that border installations. The rationale was that given their geographic location, there was a probability of NIS either occurring on installations or having the possibility of occurring in the future. A full list of all NIS occurring by state, county and bordering county is presented in Appendix A. Installations that occur close to state boundaries may have species data listed from counties both in the state in which the installation occurs and in counties in bordering states. An example is Holston Army Ammunition Plant (AAP), which is near the Tennessee/Virginia border. A synopsis of the data is presented in Table 2.

Every effort was made to develop a complete invasives list at county levels; however, several states did not have this information available. States listed in Table 2 with an asterisk(\*) appearing under the column heading “#NIS Possible for Installation” did not have county-level data. Additionally, data for Indiana was recorded at a regional (multiple county) level.

**Table 2. Number of possible NIS species for installations with top seven TES.**

State	Installation	# NIS Possible for Installation	# NIS Possible for Total Installations

Entries with an asterisk (*) are based on state-wide data as county data was not available. When state totals (column 4) exceeds combined installation values it is usually due to species without county data.			

### TES/NIS Combined Data Table

The resulting database from pairing up TES with NIS by counties containing or bordering an installation with a priority TES was extensive, with over 3,000 entries (Appendix A). Data fields included in the database are: TES, NIS common name, NIS scientific name, NIS life form (forb, grass, vine, tree), NIS habitat (where available; open, wetlands, aquatic, forest), installation, county and/or bordering county, and state. Entries without county information reflect the lack of a reliable data source for this information. These entries do not have an installation listed as the NIS may occur on or near any installation within the state. Multiple entries for any particular NIS for an installation reflects the NIS occurring in more than one county.

### 3 Discussion

Analysis was based on the review of literature and state, federal, and private agency input connecting the documented occurrence of individual NIS to an installation containing a priority TES population. Pairing potential NIS occurrence with installations accounted for 34 installations with top seven priority TES on site and as many as 400+ NIS potentially occurring on one installation.

The potential impacts invasives may have on any TES species depends upon the niche the species occupies in the landscape. NIS impact the structure, function, and organization of ecological systems (Sheley and Petroff 1999). These impacts occur at various levels and affect numerous ecological processes. Table 3 lists the levels and processes as defined by MacDonald et al. (1989).

**Table 3. Potential effects of NIS at differing scales (Macdonald et al. 1989)**

Ecosystem-level effects
Altered geomorphological processes
Erosion rate
Sedimentation rate
Elevation
Water channels
Altered hydrological cycling
Water-holding capacity
Water-table depth
Surface-flow patterns
Altered biogeochemical cycling
Nutrient mineralization rate
Nutrient immobilization rate
Soil and water chemistry
Altered disturbance regime
Type
Frequency
Intensity
Duration

Community/population-level effects

Altered stand structure

New life form

Vertical structure

Altered recruitment of natives

Allelopathy

Microclimate shift

Physical barrier

Altered resource competition

Light absorption

Water intake

Nutrient uptake

Space preemption

In the case of the Army's priority TES, invasive plants would most likely pose an indirect threat to the TES through altering required habitat. The NIS would directly impact native plant species, displacing them etc., which in turn would impact required TES habitat. Depending on the TES, these habitats included nesting, foraging, and brooding.

An example of these habitat alterations, placed in context of McDonald's definition of potential impacts (Table 3), would be non-native vining species interfering with the maternity roosting and foraging habitat of Indiana bat. During the summer months, maternity colonies roost under loose tree bark "commonly located in bottomland or riparian areas" (Garner and Garner 1992). Additionally, the bats primarily forage in closed canopy riparian forests (Evans et al. 1998) and will also forage in upland forests with closed canopies especially when water is present (Garner and Garner 1992). Camp Atterbury has Indiana bats on post along with at least three species of vining NIS: Oriental bittersweet (*Celastrus orbiculatus*), purple winter creeper (*Euonymus fortunei*), and creeping Jenny (*Lysimachia nummularia*). These three NIS all inhabit forest environments, where they have the potential to grow up tree trunks and limbs of dead and live trees, thus altering the stand structure by introducing a new plant form, effecting the recruitment of native plant species, and blocking access to tree trunks ideally suited for roosting. As with many installations, Camp Atterbury restricts human activities in and around riparian areas. Given these limitations non-native invasive species have the potential to have greater impacts on TES than military and land management activities.

REPORT DOCUMENTATION PAGE				Form Approved OMB No. 0704-0188	
Public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing this collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number. PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.

13. SUPPLEMENTARY NOTES Copies are available from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161.					
14. ABSTRACT  Threatened and Endangered Species (TES) pose a significant conservation and compliance challenge for natural resources management on military lands. In FY 2003, the Army spent over \$30 million dollars on TES management issues. In addition to the stewardship challenges TES represent to the Army, TES are a significant factor in the restriction of military activities on training lands and thus affect military readiness. One factor that may represent a significant threat to the Army's ability to effectively manage TES and their habitat on military lands is the presence of Non-Indigenous Species (NIS). NIS alter the structure, function, and organization of ecological systems, thereby affecting the suitability of the habitat to support endangered populations.  This research documents invasive plant species that have a high probability of existing in the same geographical areas as Army installations that have populations of high priority TES. This study is limited to Army installations with current populations of the top seven high-priority, federally listed, TES.
